

Dukaan Saathi

The AI business partner for every Paytm merchant — one that watches the shop, speaks the owner's language and gets things done.

Observe

Advise in your language

Act with one tap

THE PROBLEM

Every Paytm merchant has data. Almost none of them has a business partner.

Sees the money, not the why

QR and Soundbox say what came in. Nothing says why Tuesday dipped, which item stopped selling, or what to do about it.

Regulars quietly disappear

A customer who paid twenty times and then stopped is invisible. The shop loses them without ever knowing it could have asked them back.

Growth tools go unused

Offers, credit and restock timing all exist, but they need an English app, a dashboard and spare time a shop owner never has.

THE IDEA

Dukaan Saathi is an autonomous AI teammate that reads the merchant's Paytm data every day, talks to them in their own language, and gets things done – with one tap of approval.

Observe

Transactions, regulars, stock signals, settlements

Advise

A voice brief in Hindi or Marathi, not a dashboard

Act

Offers, restock, credit — executed after the merchant says yes

HOW IT FEELS

A day with Dukaan Saathi

8:00 AM Morning voice brief: yesterday's sales vs. the usual, one thing that changed, one thing to do.

8:02 AM Ramesh asks a follow-up out loud. Saathi answers from memory of his shop, not a generic FAQ.

8:03 AM One tap: the offer goes out to the regulars who stopped coming. Saathi logs what it did.

9:00 PM Evening report: who came back, what it earned, and what Saathi learned for next time.

Dukaan Saathi · voice + WhatsApp

Namaste Ramesh ji. Kal ki sale ₹6,200 — Tuesday ke average se 18% kam. Aapke 12 regular customers do hafte se nahi aaye. Unhe ₹10 chai-combo offer bhejein?

Haan, bhej do.

Bhej diya. Shaam ko batata hoon kaun wapas aaya.

WHAT IT DOES

Six things a good business partner would do for the shop

Sales Pulse

Spots dips, spikes and slow weekdays against the shop's own baseline, and explains the likely cause.

Regulars Radar

Finds repeat payers who have gone quiet and proposes a targeted nudge before they are lost for good.

Smart Restock

Learns which items move on which days and warns before a stock-out, with a ready-to-send supplier order.

Offer Engine

Drafts a small, specific offer for a specific group, sends it on approval and reports what it brought back.

Cash & Credit

Reconciles settlements, flags mismatches and pre-fills a Paytm merchant loan when working capital is tight.

Voice-first, vernacular

Talks and listens in Hindi, Marathi and other Indian languages. No dashboard, no typing, no English needed.

ARCHITECTURE

Data in, a stateful agent in the middle, real actions out

AUTONOMY WITH GUARDRAILS

The agent runs a loop, and the merchant holds the switch

Each step is a LangGraph node with typed state. The Approve node is an interrupt: the graph pauses, the merchant hears the proposal, and only a yes resumes it. Every outcome is written back to memory, so tomorrow's advice is better than today's.

Nothing moves without a yes

Offers, orders and applications are proposed, never auto-sent. The merchant approves by voice or one tap.

Never touches money

Saathi reads payments and pre-fills forms. It has no power to move funds or change settlement details.

One shop, one memory

Memory is scoped per merchant. Customer phone numbers are masked in the model context; only the sender workflow sees them.

TECH STACK

Built on the partner stack, end to end

Voice and language	Sarvam — speech-to-text, text-to-speech, Sarvam-M	The merchant talks and listens in Hindi, Marathi and other Indian languages; the brief is spoken, not shown
Memory	Cognee	Knowledge graph of the shop: customers, items, seasonality, every past recommendation and its outcome
Actions	n8n (self-hosted)	WhatsApp and SMS offers, supplier order, settlement alert, Paytm loan pre-fill — each a workflow the agent triggers on approval
Orchestration	LangGraph	Stateful agent loop with human-in-the-loop interrupts, retries and an audit trail of every decision
Reasoning	Sarvam-M, Groq fallback	Diagnosis and recommendation text; swapped by config so the demo never depends on one provider
Data and app	FastAPI, Next.js, synthetic Paytm-style feed	Mobile-first merchant screen; MVP runs on a generated 60-day transaction history, ready for Paytm for Business APIs

WHY THIS MATTERS TO PAYTM

A daily reason to open Paytm for Business, and more business on Paytm rails

Merchant stickiness

A partner that speaks every morning is a habit. Habits keep the QR on the counter and the Soundbox plugged in.

More payments through Paytm

Offers go to customers who already pay by Paytm QR, so every regular won back is more volume on Paytm rails.

Credit at the moment of need

Saathi notices tight working capital from the data and offers a pre-filled Paytm merchant loan when it is actually useful.

Built for Bharat, not for dashboards

Voice in Indian languages reaches merchants who will never open an analytics tab. That is most of Paytm's merchant base.

DEMO

What judges will see in three minutes

0:00	Meet Ramesh	Sixty days of synthetic Paytm QR transactions for his kirana and chai counter, with real-looking patterns baked in
0:30	Morning brief, in Hindi	Saathi speaks: sales dipped, twelve regulars went quiet, chai stock will run out by Thursday
1:15	Ramesh talks back	He asks "kaun se customers?" by voice; Saathi answers from Cogneer memory with names and last-visit dates
1:45	One tap	He approves the chai-combo offer; the n8n workflow fires and the activity log shows the messages going out
2:15	Restock and credit	Saathi drafts the supplier order and shows a pre-filled Paytm loan card, both waiting for approval
2:45	Day two	Fast-forward: Saathi reports who came back and adjusts tomorrow's advice — the loop has learned

Shippable at the hackathon, real with Paytm's data after it

Hackathon MVP

- Synthetic 60-day transaction generator with injectable scenarios
- LangGraph agent: observe, diagnose, recommend, approve, act, learn
- Sarvam voice brief and Q&A in Hindi and Marathi
- Cognee memory per merchant
- Three n8n actions: offer, restock order, loan pre-fill
- Mobile-first merchant screen with activity log

After the hackathon

- Paytm for Business transaction and settlement APIs in place of synthetic data
- Soundbox as the voice surface: the brief plays on the device already on the counter
- Merchant loan and Paytm offers integrated as first-class actions
- More languages; category-specific playbooks for kirana, pharmacy, salon, restaurant
- Pilot with [__] merchants in Mumbai and measure retention and repeat payments

TEAM AND ASK

Team Dukaan Saathi

Shreya Jaiswal

AI Engineer

Kritika Bindal

Software Engineer

What we would ask of Paytm

Sandbox access to merchant transaction and settlement APIs, and one real merchant in Mumbai to pilot the morning brief with.
